

The New Heavy Duty, External Loudspeaker

MLS-200

Engineered Quality

Size

The diameter of the speaker is small (3.03 in), but the MLS-200 has the performance and power rating of 12 W. Also the housing is designed to maximize the performance of this speaker driver. This allows for enough communications power even under the most noisy circumstances, yet still keeping a small footprint for tight installation applications.

Getting from here to there

The robust cable is designed to pass the maximum audio output power from the radio to the speaker with minimum loss.

Water integrity

The MLS-200 is protected against water immersion, IPx5. If water does enter the speaker grill, it is quickly drained allowing for maximum clarity and performance. This means the MLS-200 can withstand the harshest environments, including severe wind and rain.

Clear sound

This is the major sales point of this speaker. The most important factor of a communications speaker is the quality of the sound. We have designed, the ideal audio response, housing, and porting to obtain the best possible performance.

Vibration integrity

Since this speaker was designed to be installed on a motorcycle, the thick mounting plate and bracket are built to endure hard vibration. The adjustable angel capabilities of the speaker are also built to withstand hard vibration yet provide support at any angle.
